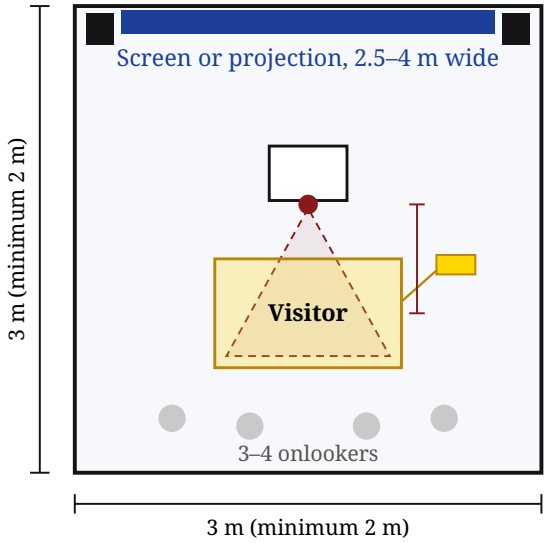
ADAF 2027 “It’s Alive…”

One visitor at a time plays with one hand in front of a webcam; others watch the large image. All hardware is provided by the festival; the artist supplies and installs the software. The work runs fully offline in Chrome on a single computer and resets itself between visitors. Session length is about 2.5 minutes, with no staff needed during opening hours.



- Webcam on plinth at chest height (≈1.3 m)
- Visitor 0.8–1.5 m from the camera (floor mark)
- Soft LED panel lighting the hands from the front
- Stereo speakers or a soundbar beside the screen
- Plinth or table for the computer and camera
- Display: ≥ 43″ screen, or projection 2.5–4 m wide

Room: dim. No bright window or projector beam behind the visitor, so the camera can see the hands.

Flexible: works from a single monitor on a plinth up to a wall-size projection.

Floor plan, top view (not to scale outside the room outline).

Equipment

Item	By
Computer: laptop or mini-PC, Windows or macOS, 8 GB RAM, from the last ~6 years, with Chrome	**Festival**
USB webcam, 1080p, with a mount or small tripod	**Festival**
Screen ≥ 43″, or projector + projection surface	**Festival**
Speakers or soundbar (stereo, 3.5 mm or HDMI audio)	**Festival**
Plinth or table, about 1.1–1.3 m high	**Festival**
Soft LED light on the visitor area	**Festival**
HDMI cable; power for computer and display (+1 for a projector)	**Festival**
A3 print of the bilingual gesture placard (file supplied)	**Festival**
The software, installed and configured on the festival computer	**Artist**
Print-ready placard file and floor marking guide	**Artist**

Operation

- **No internet needed.** Hand tracking, 3D and sound all run on the computer.
- **Start of day:** switch on, double-click the YiayiaOS launcher. It opens full-screen with camera and sound.
- **During the day:** nothing. An open palm starts a session; the piece resets after 30 s with nobody in front of it and refreshes itself periodically.
- **End of day:** close the window or shut the computer down.
- **Sound:** moderate level, synthesised live (drone, bells, voice-like effects). Headphones are not suitable; onlookers should hear it too.
- **Privacy:** the camera image is processed on the computer and never recorded, stored or sent.
- **Photosensitivity:** no flashing faster than 1.5 Hz; a calm mode without pulsing is available.
- **Set-up:** about 1 hour. The artist installs the software on the festival computer (on site or remotely) and aligns camera and light.
